

prints that on the screen. This is done to make it visible for humans, which in this case, will only pass hello for the default place and remain there.

Standard input- Standard input or 'stdin' is the place for the commands to pass on information. Let's take an example if you type (ball) without any arguments then it listens to the input based on stdin while outputting the same type for standard output. This is done until the EOF character is sent to it (control + d).

```
$ ball
hello there
hello there
say it again
say it again
[ctrl + d]
```

Along with standard input and a string of command follows directly.

Standard error- The Linux system commands receive input from the terminal and send the generated output back to the terminal. This command can read input from standard input which is present in the system by default. This command can write the output to standard output which is also in the terminal by default. The standard error or 'stderr' is quite similar to the standard output or input, but it also refers to a place that holds the error messages. In this, the script returns from the shell window or the terminal.

Redirecting standard output and error to a file

Linux redirection is a feature that facilitates the standard input and output device while executing any command. Its workflow for any command is taken as input and passed on as output.

- Standard input device refers to the keyboard
- Standard output device refers to the screen

Standard output redirection

For the standard output redirection, ">" symbol is used. Ex - Is -al > listing

In this, the output command Is -al redirected to the "listings" file rather than the screen. If you are not willing to overwrite the file but wish to add more content to the existing file then you can also use the operator ">>". The standard output can also be directed to the devices as-

- `$ cat music.mp3 > /dev/audio`

The command mentioned above can easily read music.mp3 and transfer the output to the audio device, which is dev/audio. It can also play the music file if the sound configurations are correct in your system.
