Text Editors

Edit text on a classic and popular text editor, Vi, in the Linux family.

Sometimes, the intrinsic text needs a user-friendly and feature-ready tool for editing. To edit text on Linux, there's a Text Editor called Vi(Visual Instrument). Vi helps accomplish work with exclusive keywords instead of menus. Vi works in either insert mode , command mode and command line mode. Insert mode is where the text that you type in becomes the part of the document, and the command mode is where each keystroke is considered a command by the system. You get the command line mode by inserting the colon : key. I you press the key 'i' during the command mode, it turns the editor into insert mode.

Vi is a modal editor; thus, the above two functions are possible without having to go to the home button to assign individual functions to specific keys. Vi has several purposes, but the primary one was to make visual text editing user-friendly for users and make the text attractive for them.
