

## Identifying compatible packages for your Linux Distro

Linux OS is traditionally involved with coders and programmers as a reliable operating system. However, it is continually attempting to be attractive to the masses. The LINUX operating system comes in multiple forms known as distros or flavours. The reason behind this factor is that it is configurable, and different platforms tend to develop the same interest. They also support the cloud-based applications which may usually run through a browser. It has a variety of ranges, especially for the bundled software. Linux OS is customisable, and it has specific functions that are far beyond and standard Mac or window utility. There are multiple concerns for which it is essential to determine which Linux distro can work best for you. Like-

- Do you require GUI familiar to Windows
- What about security
- Typing commands or clicking the icons

## Identifying which one is right

There are multiple packages, desktop managers and distribution systems out of which you have to choose the right distribution system. To find the compatible package, invest time into downloading and trying out multiple distros. You can start this with the top 10 systems and then try them one by one.

## Compatible packages

The compatible packages in Linux distro are-

- **Arch Linux-** Arch Linux package uses `pkg.tar.xz`, and it also has its manager known as Pacman. It also does not have a graphical installer where the actual installation process is done with the help of a terminal.
- **Gentoo Linux-** Gentoo Linux package is based upon the portage package management system, and it can be a little difficult to install. But the ultimate advantage is that software can be built for specific hardware.
- **Slackware Linux-** it is the oldest Linux distribution system which is also used today, and it doesn't have a package manager in it where all the system administrator compiles all the software.
- **Graphical user involvement-** The graphical user interface or desktop environment is displayed on the monitor and it is how the actual system looks. Some of the popular tests of managers in this segment are Cinnamon, KDE, LXDE, Gnome, and a lot more.
- **KDE-** this system was initially created in the year 1996, and it has probably the most advanced features in the market. KDE by default includes multiple
