

Debian/ Ubuntu-

- `sudo apt-get upgrade`
 - o Only upgrade the installed packages whenever possible
- `Sudo apt -get dist- upgrade`
 - o it may add or remove the packages to satisfy the dependencies
- `Sudo apt upgrade`
 - o Like apt-get upgrade
- `Sudo apt full -upgrade`
 - o Like apt - get dist -upgrade

CentOS-

- `Sudo yum update`

Fedora-

- `Sudo dnf upgrade`

FreeBSD packages-

- `Sudo pkg upgrade`

FreeBSD ports-

- `Less/use/ports/UPDATING`
 - o You can use 'less' to view the updated notes for the ports (use Arrow keys to scroll and press q whenever you want to quit)
- `Cd/ usr/ports/ports-mgmt/portmaster && sudo make install && sudo postmaster -a`
 - o Install 'postmaster' and then use it to install the ports

Updating package index- the package index is a database of all the available packages from repositories, and it is defined in `/etc/apt/sources.list` file. It is also defined in `/etc/apt/sources.list.d` directory of the repository and to update the local package index with all the latest modifications in the repository you have to type- `Sudo apt update`

Upgrading packages- gradually with time the updated versions of dependencies are packages installed on your system, which can also become available from package repositories. to upgrade your system, you have to initially upgrade the package index (mentioned above) and then type- `Sudo apt upgrade`

Removing repositories

Removal of the repositories or packages is a straightforward process and to remove any installed version you have to type-

```
sudo apt remove nmap
```

To remove multiple packages, you have to specify them if they are installed or removed, and then separate them by spaces.
