

at the CLI is a waste of time. Want to get into AI? Most of the tools use CLI. Want to get into dev-ops? CLI is a must. Be a full-stack developer? Again, you need to dominate the CLI. It's with this aim that we bring you this FastTrack which covers all the bases. From installing your terminal, be it on Linux or Windows, to learning the most commonly used commands to finally mastering the command line to the extent that you could do your job blind. Each chapter focuses on a singular aspect while listing out all the common and must-know commands with proper examples. We hope that you follow each chapter while practising the commands on a CLI. That's the best way to learn and hopefully, we'll set you on the path to hacking the command line.

As always, we're open to suggestions for future FastTracks, complaints and anything else that you'd like to opine about. You can shoot your emails to editor@digit.in
