

Few commands

There are some commands through which you can easily find out which package on a particular file. Some steps that you have to follow are-

1. First, open the terminal application
2. Now you have to type this command to find which package can provide / use/bin/passed file-
`Dpkg -S /usr/bin/passed`
3. Use the Apt file package for searching the utility-

`Apt-file search vim`

Find the package providing file- you can easily search for the filename from the installed packages list using the command (dpkg -S). For example, to find the package name /bin/Is you have to enter-

`$ dpkg -S /bin/Is`

The options like -S or --search actively search for the entered file name from installed packages and by adding the below mentioned coming you can obtain further details regarding the status of the file name for the package.

`$ dpkg -S coreutils`

Dpkg query command- the dpkg query command is a powerful tool that can show the status information regarding the packages listed in the database of dpkg. The option -S search for the filename from all the installed packages and standard shell wild-chars can be utilized in the same pattern. This command cannot list additional files developed by the maintenance scripts also it will not list any of its alternatives **d**
