

Here is a quick demonstration of this fact:

- `[me@linuxbox ~]$ echo $((0xff))`
- 255
- `[me@linuxbox ~]$ echo $((2#11111111))`
- 255

Unary operators

Positive and negative are unary operators indicating with the number.

Simple Arithmetic

The following table represents the list of arithmetic operators in the shell.

ARITHMETIC OPERATORS	OPERATOR DESCRIPTION
+	Addition
-	Subtraction
*	Multiplication
/	Integer division
**	Exponentiation
%	Modulo (remainder)

Here you must note that shell arithmetic operates in integers only so the results for the division will always be present in whole numbers.

- `[me@linuxbox ~]$ echo $(( 10 / 3 ))`
- 3

Assignment Operators

NOTATION	DESCRIPTION
<code>parameter = value</code>	Assigns a specific value to the parameter.
<code>parameter += value</code>	Addition. Equivalent to <code>parameter = parameter + value</code> .
<code>parameter -= value</code>	Subtraction. Equivalent to <code>parameter = parameter - value</code>
<code>parameter *=</code>	Multiplication. Equivalent to <code>parameter = parameter * value</code> .
