

- `[me@linuxbox ~]$ foo=(a b c d e f g h)`
- `[me@linuxbox ~]$ echo ${foo[@]}`
- `a b c d e f g h`
- `[me@linuxbox ~]$ unset foo`
- `[me@linuxbox ~]$ echo ${foo[@]}`
- `[me@linuxbox ~]$`

we can also use the unset command to delete any specific array element.

- `[me@linuxbox ~]$ foo=(a b c d e f g h)`
- `[me@linuxbox ~]$ echo ${foo[@]}`
- `a b c d e f g h`
- `[me@linuxbox ~]$ unset 'foo[3]'`
- `[me@linuxbox ~]$ echo ${foo[@]}`
- `a b c e f g h`

In the following example we are deleting the fourth element with subscript 3. (Notice the arrays starts with zero elements)

Associative Array

Most of the current version of the bash now fully supports associative arrays. With these associative arrays, you can use strings rather than integers as array indexes. For instance, this is an array with 'colours' and comes with colour name as indexes.

- `declare -A colours`
- `colors["red"]="#ff0000"`
- `colors["green"]="#00ff00"`
- `colors["blue"]="#0000ff"`
- `echo ${colors["blue"]}` **d**
