

encies, and agree to change project settings. Now, you will be presented with a long list of the assets you want to import. Make sure all the checkboxes are ticked, then select import. The Asset Store window can now be closed. You are now ready to go create a game! Welcome to Unity Playground, a project for 2D games, that allows you to quickly create and modify various types of simple 2D games. This is ideal for teachers, kids, presentations, and essentially any reason you might have to come up with a simple, 2D game. We will not be using much coding or scripting here, and going to only use the bits and pieces that we need. The Asset Store is also a great resources for downloading prefabs and animated sprites for your projects.

The Unity Asset Store

Enter the Playground

Once you open the project, all the assets for the project are under the Project directory in the bottom left pane, accessible through a menu on the bottom left. The assets are the animations, pngs, gifs, scripts, tiles, backgrounds, 3D models, and all the basic objects that are used within a game. The assets will also have compound objects, such as, prefabs UI icons, or health and damage bars. Prefabs are assets that can be constructed based on other assets. For example, after adding a costume and a hat to a base player character, you get a constructed prefab with that combination. This prefab can then be handled as say a single image file. Whether to handle the cluster of things that represent a player as three different assets or a single one is the kind of choices that game designers need to take, considering how demanding it will be in terms of system resources, as well as how easy it is to craft the game using
