

top right, which are added by default when these types of objects (images) are added to the Hierarchy. Now, in the Sprite Renderer component, which is in the Inspector panel, there are a few values that need to be tweaked.

Under the Draw Mode option, change the setting from Simple to Tiled. This makes the image repeat along the edges any time it is shown on screen. Now, the width and height can be changed if needed. We changed X to 32 and Y to 17. This makes sure that the initial tiled piece extends beyond the range of the camera, which is what is visible to the player once the game is made.

What will appear on the camera is indicated by the rectangular white box. This is because as it is a square tiled graphic, the width and height have to be the same for the graphic to render as intended. Under Additional Settings, change Sorting Layer of the Image to Background. This makes sure that the image always appears as a backdrop to anything else that is placed within the game.

Now go to **Image > Spaceships**. There are two spacecraft images available here, but let us mix things up a bit. Go to Google Image Search, and find a spacecraft that you would like to use. Make sure that the image allows you to add a flame animation below the Spaceship, with some kind of nozzle between the fins at the bottom.

Also, look for a .png by selecting the colour as “transparent”. Once you have a spaceship that you like, save it on your local computer. Once you have saved the image file, right click on the black space next to the existing Spaceships, and select Import New Asset. Now, select the image file that you just downloaded, and bring it into the Assets directory. Change the name to MyShip. Now, you can select MyShip, and drag it into either the

Adding the background to the project
