

Interactive elements and UI

Learn how to add UI elements such as health bars and more to your game

In this chapter, we will be adding various kinds of perils for the player, as well as giving visual feedback on what is going on through the UI. The two are tied together, because when the spaceship collides with an object, it loses health, which has to be shown on screen, or when the player blasts away an enemy with their weapons, that also has to be indicated on the screen with a score. All of these actions will be processed to give a winning or a losing condition for the game. If the player loses too much health, it is game over. If the player manages to reach a target score, they win.
