

and press the Add Component button. Look for Health System Attribute, and add that component. In the Health field, will be the amount of health given to the spaceship. The default value is 3, which can be changed if you want to. This number will decide how many times the space-

The Modify Health component

ship can collide against an asteroid, before it loses all health, and gets destroyed. Now select the asteroids, and add the Modify Health component. The default value is -1, which can remain. Add the Modify Health component to all the asteroids. If you want, the the Health of the ship can be increased to 7, and the more massive asteroids can be given a higher value for removing health when collided against, say -2.

Now, it can be time consuming to add the same component to many asteroids. A shortcut is to make a single asteroid, and to duplicate it. Right click on one of the asteroid GameObjects, and select Duplicate. Now the duplicate Asteroid will be created right on top of the old one, simply click on it and drag it to another position in the Scene. All the components and the attributes of the original Asteroid will also be duplicated. Another, superior method of achieving the same end result faster is to drag an asset from the Project Browser into the Hierarchy panel and add the appropriate Components such as Rigid Body, Polygon Collider 2D, and Modify Health, then drag the GameObject back to a folder in the Project panel. This converts the GameObject into a Prefab. Why this approach is better is because you

The default Prefabs with the blue icon, that come readymade with Unity Playground
