

Converting a GameObject to a Prefab. Notice the colours of the cubes in the Hierarchy panel.

can modify the Component values on a prefab, and they will affect all the instances of the Prefab within the scene at the same time. When handling a large number of duplicate components in the same scene, converting a GameObject to a prefab makes a lot of sense. The GameObject is indicated with a grey cube, while the prefab shows up as a blue cube. Once the Prefab is made, you can drag and place as many of them as you want within the scene.

Adding UI

We are now going to add UI to the game. This is a very basic indication of the health and score of the spaceship. Go to the Prefabs folder in the Project

Tweaking the UI in Playground.
