

panel, and simply drag the User Interface prefab into the Hierarchy panel. Now, make sure you are in the Game view because the Scene view will not display the UI. This will show a Health bar as well as the score. The UI in the hierarchy has a tree structure of its own. Go to `StatsPanel > Left-Label` and find the Text Component in the Inspector panel. Change the value from “health” to “Shield Integrity”. This is a long and cumbersome name, but we are going to keep it. Now because you have already tagged the MyShip gameobject as the Player, the UI prefab knows to do a number of things. It knows to display the Shield Integrity of the spaceship, and change the value when the spaceship collides against the asteroid. If the health reaches zero, the UI will display a Game Over text. Let us go ahead and change this right away. In the Hierarchy panel, go to `UserInterface > GameOverLabel` and change the Text component in the Inspector panel from “Game over” to “Rekt!” or anything else that you may want. The Player tag on MyShip also allows the UI to know the winning conditions, which is when the score hits 5. This can be seen in the UI Script component of the UserInterface prefab. 5 is the default value for the Score to Win attribute.

While at this point in time, it is possible to lose health after colliding against an asteroid, and for the player to lose the game, or get rekt, there is no way that the player can accumulate points, or score enough to meet the winning condition. Usually, it is a good idea to give your players a chance to win the game. We will let the players do this, by giving the spaceship laser blasters.

The Game Over screen. Notice the ship disappears when it reaches 0 health.
