

ject to LaserBlaster, by right clicking on it, then selecting Rename. Click on Add Component, and look for Object Shooter. While there is no visual indication in game, this represents a point from which the projectiles will appear. Drag the LaserBlaster to the nose of the ship, or if you want to fire from one or two sides, then those sides. In the latter case, you will have to use two Empty GameObjects, naming them LaserBlasterR and LaserBlasterL. Since the blaster is small and almost invisible, represented by a transparent circle, it can be difficult to directly manipulate. You will have to change the values in the Trans-

Resist the temptation to do this. It is also very likely to fry your machine.

form component to do this easily. If your ship is located in the middle of the screen, this can be achieved by simply tweaking the value of the Y position. Then, drag the Object Shooter Component into the MyShip folder, which will also have the P_Flame prefab. The Object Shooter component will have an Object To Spawn attribute. Drag and drop the laser projectile from the Prefab folder in the Project panel, directly into this field. A green arrow indicates the direction in which the Object Shooter will fire the components. By default, the X and Y values are 1. This fires the projectiles at a 45 degree angle to the ship. Change the X value to 0 and the Y value to 1, to fire the projectile along the axis of the ship. As the Object Shooter GameObject is a daughter of the MyShip GameObject, the direction of fire of the projectiles are relative to the orientation of the ship, and not absolute, or in relation
