

Adding the Destroy for Points Component on an Asteroid.

to the scene. Now you have two additional attributes that you will have to fine tune after running the game. These are the Creation Rate and Shoot Speed. The default value is 0.5 and 5, and at least the shoot speed will have to be ramped up. The Creation Rate can be reduced, to whatever best suits you. Sensibly, the lower the creation rate, the faster the bullets spawn. The value represents the number of seconds between two bullet spawns. This decision probably prevents designers from frying computers around the world by making 1000 bullets spawn every second. Change the Key to Press value to Ctrl or whichever button you want to use for firing the blaster. By default, this is Space, which is the same button used for the boosters. Leaving it on default will make the ship fire every time it actively moves, which makes for interesting, awkward and gimmicky gameplay, but hey, it can still be fun. Check out the game now, a satisfying shower of bullets should come out of the ship.

Now we have to inform the asteroids that they are supposed to get destroyed when struck by bullets. If you used Prefabs for the asteroids, you can simply add the relevant Component to the prefab, effecting the change on all the asteroids in the game. Otherwise, you will have to add the Component individually to each of the asteroids in the scene. Either way, click on the Add Component button, and search for the Destroy For Points Component. This component automatically adds a collider component, to detect the incoming projectile. You will be given a choice on which particular collider component to add, Circle, Polygon or Rectangle. The Polygon col-
