

tagged as Player 2, which is what will pass on the necessary information to the UI. Yes, this might be confusing, as the Component has a Health Attribute, it is just that the Component itself has the word Attribute in its name. Now, you do not have to make too many changes to the UI. Click on the UserInterface Prefab in the Hierarchy, and change the Number Of Players to Two Players, and change the Game Type to Life. Now, although the UI will show the default health and score labels in th Game view, once you actually run the game, it will correctly show the Life of Player and Player 2. Now, play the game again.

At this point, both the spaceships stay within the play area, can fire at each other, but the lasers pass harmlessly through the shell, without hurting the players. To allow the projectiles from each ship to reduce the health of the other, click on the Ship-A-laser prefab in your Project directory, and add the Modify Health Component. Now, go to the Ship-B-laser prefab, and add the Modify Health Component there as well. As the components were changed directly in the prefab, it is automatically updated in the blasters, which is the beauty of using prefabs. Any changes affect all the instances of the prefab in the game. Now play the game to test if the blasters work as intended. Each of the laser fires affect the other ship. Let's make this more fun by giving each ship, 50 health, so that the dogfight is not over in like 5 seconds.

Now, it is time to bring the asteroids into the field, to add some obstacles to maneuver around for the two spaceships. The asteroids serve two roles in the game, they can be used as cover, and be obstacles at the same time. In the prefabs for all the asteroids that you are using, make sure that the Points Worth attribute in the Destroy For Points A component is set to 0, as

Adding asteroids for cover
