

Make sure the blasters are outside the ship

the main motive of this game is to kill the other ship, and not win the game by getting points by shooting asteroids. Place three asteroids in roughly a straight line, and play the game. Test the game by shooting at the asteroids with one of the spaceships. You will notice that the laser blast destroys an asteroid, and keeps moving, destroying every subsequent asteroid it encounters. The two spaceships will pulverise the asteroid field in no time if the projectiles are allowed to behave like this. Now, we have to make sure the blasters are positioned just above the nose of the ship, so that they do not collide with the ship itself, and depending on the Components used, get destroyed as soon as they are spawned, or cause the player firing the lasers to lose health. Precisely control the Y position of the blaster on both the ships. We will be now using Conditions and Actions Components, which are If Then statements.

Go to the laser projectiles of both the ships and remove the check on the Is Trigger attribute in the Capsule Collider 2D component. The reason why this was checked in the first place, if you remember, was to make sure that the bullet does not interact with the objects physically, by exerting a force against it. As a consequence, the bullet simply passes through the asteroids. What we will be doing is destroying the bullets as soon as it collides with the asteroids, so that it does not exert any force against the asteroid, and additionally, the asteroid also gets destroyed. At the very top of the inspector window, change the Tag of the lasers of both ships to Bullet. Note that these changes are to be made to the projectile prefab in the
