

The final game

Project panel, and not the Blaster A and Blaster B daughter GameObject in the Hierarchy panel. Now, go to the asteroid prefab, and add the Condition Collision Component. Check the Filter By Tag box, and select the Bullet tag from the drop down menu. Click on the + sign under gameplay actions, and choose Destroy Action, which adds the Destroy Action Component. In the Destroy Action component, ensure that Object That Collided is selected in the Target Attribute drop down menu. Now, play the game again.

There is a new problem now. Since the bullets are no longer a Trigger, and actually collide, they bounce off the edges of the playing field, or the boundary to keep the asteroids and spaceships within the window. To prevent this, we will be adding the Condition Collision Component and the Destroy Action Components to the boundary as well. Make sure to filter by the Bullet Tag, or the boundary of death will indiscriminately kill everything that touches it, including the Players and the Asteroids.

Scatter multiple asteroids around the playing field. This is where you will be designing your first level. Let us make the game a little more interesting and dynamic by making the asteroids rotate slowly. Go to the Asteroid prefab, and add the Auto Rotate component. The Speed attribute can be tweaked as per your liking.

It might seem like most of your work is done at this point, but you are actually getting started. Right now, this is a functional game, but to make the gameplay experience fun, you have to keep tweaking so many things. It might be the angular friction of the spacecraft, to one that feels best, and
