

archy and delete them. Delete the ShipB Prefab from the Hierarchy panel as well. Click on the UserInterface Prefab, and go to the UI Script Component. Change the Number of players Attribute to One player, and change the Game type to Score. Change the value of the Score To Win attribute to 100. The Modify Health attribute can be removed from the Ship-A-laser prefab, after you make a copy of it and rename it to ensure that it does not mess with the Dogfight Scene.

Select ShipA and change the Type Of Control Attribute to Arrow Keys. In the Push Component, change the Key to Space. In the BlasterA Game-Object, the Key To Press Attribute in the Object Shooter Component can be changed to Left Ctrl.

Adding waypoints to the MasterSpawner

In the Project panel go to **Assets > Prefabs** and create a new folder called Asteroids. We will be using this folder to save all the new Prefabs and Prefab variants created for this particular game. Copy the Asteroid Prefab from the Dogfight folder, into this folder, and give it a different name, say Asteroid-1-a. Note: If for any reason you are not able to copy, paste or rename files in the Assets folders, you can just as well use Windows Explorer for the same purpose, to copy Prefabs, rename them and move them into different folders. Since this game does involve giving points for destroying asteroids, let us change the Points Worth attribute in the Destroy For Points At component back to 1 from 0. Create an Empty GameObject in the Hierarchy panel, which is represented by a translucent
