

A simple turret game made with geometric shapes, a turret .png and some bullets. There is no Push component on the stationary turret, only the Rotate Component.

circle. Position it somewhere within the scene, preferably at a distance from the Ship. Make sure the Gravity of the Rigid Body 2D component is set to 0, or the spawner will simply fall to the bottom of the screen. Search for and add a Component called Object Creator Area. This creates a Box Collider, within which new asteroids are spawned. This is an invisible box, but it is still a 2D Collider, and we do not want the ship to bounce off an imaginary square in the middle of the playing field. For this reason, we have to check the Is Trigger Attribute. Change the spawn interval to 5, an interval that is counted in seconds. Play the game to test it. It is very likely that the Asteroid will be too large or too small. Additionally, the Asteroids rotate in place once spawned, then suddenly bounce to other ends of the screen when the next Asteroid is spawned. This is because they spawn on top of one another, and the colliders on both work overtime to get as far away from each other as possible, because they are both in the logically impossible state of completely overlapping.

To fix the size of the Asteroid, change the Scale values in the Prefab, in the Project Panel and not the Hierarchy, to something suitable. Now, we will add a component to make the Asteroid move randomly and erratically. Search for and add the Wander component. The speed can be increased, and the interval of change in direction can also be changed. This interval is counted in seconds. Uncheck the Keep Near Starting Point box, as we want the asteroids to really go all over the map. Now play the game.
