

At this point, the asteroids simply disappear when shot at. It would be cool if there was some visual indication of the destruction. We are going to add an explosion to the asteroids, when they get destroyed. Go to the Asteroid prefab (the particular Prefab used for this scene), and find the Destroy Action component. Now navigate to **Assets > Prefabs > Particles**, and drag and drop the P_Explosion Prefab to the Death Effect field. Play the game now, and you should see a cool explosion every time an asteroid is destroyed.

The game is nearly finished, but as always there are endless ways to improve it. You can tweak the rate at which the asteroids are produced, or change the frequency at which they change direction and so on. One of the interesting things to do is increase the rate at which Asteroids are spawned. Note that this approach will tax most computers. To do this, we will be nesting the GameObject that spawns Asteroids. To do this, drag the AsteroidSpawner GameObject to the Project panel to convert it into a Prefab, and delete it from the hierarchy. Now, create a new Empty GameObject, and rename it to Master Spawner. Add the Object Creator component, and make sure that the Is Trigger box is checked in the Box Collider 2D Component that gets added automatically. Now, in the Prefab To Spawn field, drag and drop the AsteroidSpawner Prefab. Set the Spawn interval to 20. What this does is, every 20 seconds it spawns a GameObject that themselves spawn more asteroids. This exponentially increases the number of asteroids in the field, as there will be three spawners pumping out an asteroid every 3 seconds after a minute. Now we do not want all the asteroids to be spawning from the same place. At the same time, as the Is Trigger box in the Box Collider 2D Component of the spawners are checked, if we add the Wander Component to either the MasterSpawner or the AsteroidSpawner, the spawners can simply wander out of the boundaries. To fix this, we will be using another Component known as Patrol to the MasterSpawner. Click on Add Component and search for Patrol. You will instantly get one waypoint, and the MasterSpawner will alternate from its starting position to that waypoint. Click on + to add a few waypoints around the play area. You can tweak the seconds in the Speed attribute. This ramping up of asteroid production is along the lines of what was implemented in the original game.
