

colours from the prominent colours in the decorations that you download. We used teal and the aptly named aerospace orange. This gives a uniform look and feel to the entire track. Then, trace the outline of the track with the pen tool, and stroke the path. Save the file as a .png. The decorations were just to get the colours right. Now, make separate image files for each of the decorations. This is the path that we came up with. Save As for web, because really, the difference is 90 MB for a 5000x5000 px file, and there is no need to make this simple game that large because of an unoptimised asset.

This is the racetrack that we came up with.

Close the image editor and head back to Unity. Create a new folder for the racing game under prefabs. Create a new folder under images as well, because there are a number of assets to import in this game. Import the track and the decorations into this folder. Even with a 5000x5000 px image, you probably need to scale down the spaceship a bit, and scale up the racetrack a bit. Don't overdo either, especially scaling up the spacecraft, or the image will look very pixelated. Add the Polygon Collider 2D component to the racetrack.
