

To Win Attribute to 7. Use an image editing software to create a checkerboard waypoint, and import it into the game. Drag it into the hierarchy, and add The Polygon Collider 2D component, then make sure to check the Is Trigger box. Add the Collectable Attribute Component as well, which will make the waypoint disappear once the ship crosses it. Now, drag and drop the waypoint GameObject into the Project panel to convert it into a Prefab. Now, Pepper 7 waypoint Prefabs around the track, with the last one at the finish line. The game is finished, have fun racing.

A rescue mission game

Next up, we will be making a game where the spaceship has to move around the playing area and rescue stranded aliens. For this game, we will again use the base scene that we had saved earlier. We need the camera to follow the ship, as well as a blaster on the ship. Make sure that the appropriate Components are present, with the right values for the Attributes. If there is something in the game that is not behaving as expected, the problem is very likely with the Components and Attributes. Make sure that the Points Worth value in the Destroy For Points Component is set to 0. Use two asteroid designs for the game. We need the asteroids to be destroyed by the bullets, but not award any points for it. We will be awarding points for rescuing aliens, by collecting them with the spaceship.

Go to **Images > Creatures** and drag the two aliens into the Hierarchy panel. Add the Polygon Collider 2D components to both the aliens, and check the Is Trigger box. Add the Auto Rotate script to both the aliens, and change

Rescuing Aliens by shooting out the asteroids blocking them
