

the value to something that is different from the Auto Rotate Component on the asteroids. Add the Collectable Attribute script to both the aliens, giving them a single point. Bear in mind that the Score to Win Attribute in the UI Script Component of the UserInterface Prefab is set to 5, so we need to place as many aliens or more in the playing area, or the Player will have no way of winning the game. Now, make the aliens into Prefabs. The rescue mission folder in your Project window should now have Prefabs for the the ship, the blaster, the laser projectile, the two asteroids and the user interface. Drag and drop the two aliens into this folder, to make them Prefabs as well. You can now move on to the level design phase. Now, delete any asteroids still in the scene, as well as the aliens. We will be repopulating the entire scene from the prefabs. Drag and drop asteroids into the scene, arranging them in clusters in such a way that they have to be destroyed for

the ship to navigate to and pick up the aliens. Place 5 aliens around the scene, with clusters of asteroids all around. You will need to use many, many instances of asteroids for this scene.

Now, you can combine these various types of games into new ideas. For example, you can make an asymmetric pvp game where one player has to destroy aliens, while another player has to rescue them. You can also make a dogfight plus alien rescue game, where either player gets penalised for accidentally shooting the alien. There are endless ways where these basic building blocks of a game can be put together. **d**
