

start Scene, and play once through the game to see some of the capabilities of 2D Game Kit. You can design levels for a platforming game, add in keys that unlock doors, collectable weapons, waypoints for telling the story or giving tips, portals for teleporting and moving platforms. Let us begin by making our own scene.

The interface is slightly different from the base version of Unity because this is a special project. It has a Kit Tools Menu, which has a Create New Scene option. This is different from the **File > New Scene** option. What this option does is create a starting point for you to start the game creation process, with the mundane repeated tasks taken care of. The new scene is created with a background, a camera, a fully setup player character, and UI elements, including a health bar. This creates a New Scene in the top

A new scene in 2D Kit, without any changes.

level of the Project. Create a New Scene using the Kit Tools menu, give it a name such as MyScene1 and click on Create. Then, in the root of the Project folder, right click and create a new folder called MyScenes, and drag and drop MyScene1 into this folder. Now, we can start making the 2D game.

Static and interactive objects

Play the game, after making sure that the Maximize On Play option along the top bar of the Game View is toggled. One of the first things you need to change is in the Game View itself. Near the top right of the window, you will see a drop down box that says Free Aspect. This is an aspect ratio that occupies as much space on the screen as possible, after showing the neces-
