

go back to the Scene view, and just use the mouse pointer as a paintbrush to paint your level.

There are a few tools in the Tile Palette that will make your task easier. The most important tools are the Paintbrush tool to create your platforms, and the erase tool to remove the individual tiles. Right click and drag to pan the scene. This should be enough to create the skeleton of your first level. The tiles automatically change appearance based on the surrounding tiles, so the tiles exposed to the surface will have a grass layer, which the ground tiles will not. Note that Ellen, the main character, can jump up to five tiles upward or forward.

Now while creating the level, there are a few things that you have to bear in mind to add later. Keep some gaps or holes in the platforms where you can fill liquid. This is to add acid, which kills the player when they fall into it. The player should be able to jump over these pools. Create one or two larger pits filled with acid that the player cannot jump over. Here, we will be adding moving platforms for the player to navigate through. Also make a passageway with floor tiles placed about four to five tiles apart vertically. We will be adding a block at the start of this passage, that has to be destroyed by the player to proceed. Also make ledge with a drop of between four to five tiles. We will be placing a monster at the bottom of this drop.

Do not be unduly worried about all of this though, as you can open up the Tile Palette at any point during the game, and go about tweaking or extending the base tiles and irrespective of what additions you make later on.

Scaling and moving the sky to fill the background of the level.
