

Once you have created the level, zoom out and check if there are any blank spots around the edges, where the background is not visible. If this is the case, in the Hierarchy panel, go to the Backgrounds spacer, and select the Sky background. Just drag and scale it till it is in the backdrop of the entire map that you created. You can see that the Sky GameObject is actually made up of a number of Daughter GameObjects, and you can actually create your own from the individual elements. However, you will have to go through the next section to understand how to do that in this stage itself.

The scene after adding decorations

Adding decorations and challenges

Next, we will be improving the appearance of the barebones level by adding elements to the level. All the artwork assets are stored in the **Assets > Art** folder and are nicely categorised into subfolders. Go to **Assets > Art > Sprites > Environment**, and find the Dropship. Drag it into the map near the spawn point of Ellen. Now, go ahead and decorate the environment from the assets in this folder. If you want to place an object behind the tiles that form the level, then go to the Sprite Renderer Component in the Inspector, and key in -40 in the Order In Layer Attribute, under Additional Settings. The Sky is at layer -100, so you can actually choose any layer between -100 and around -10. You can change this number in positive or negative integers to order overlapping objects within the game. There are some assets that appear with a right arrow mark next to them. These are known as Sprite Sheets. Instead of importing a lot of image elements that
