

will make the designing cumbersome, sprite sheets have related elements such as rocks or plants on a single image. The engine then automatically isolates each element within the image, which can be dragged individually into the scene when you expand the cluster of images by clicking on the arrow icon. Importing the entire sprite sheet into the scene view will create a new animation, which cycles through all the images in the sprite sheet, which is something that you do not want to do. So to add plants, or hanging bushes, click on the arrow, then drag the asset into the scene view, and position it where you want to. You can also craft your own background, if you

Adjusting the area occupied by the acid.

have been overenthusiastic about all of this and have created a large level and are running out of the background provided with the scene. This can be done using the Sky, BG Rocks, Distant Mountain and Clouds elements.

We have a beautiful scene, but this is not a tour, and without some kind of interactive elements, obstacles and challenges to the player, it will be a very boring game about merely navigating creatively-placed platforms. For this, we will have a look at the player character, Ellen. Ellen is made up of a number of components, and many daughter GameObjects. If you want to look at all the different animations, go to **Art > Sprites > Animated-Sprites > Ellen > Animations**. The main component that we need to look at is the Damageable script. There is an attribute called Starting Health, which is set at 5. Go ahead and change this to 7. The UI automatically changes now to show 7 hearts, if you go over to the Game view and hit play.

Now, Go to **Prefabs > Environment**, and look at the two prefabs there. There is a spikey plant that causes damage, through the Damager Component, as well as an Acid prefab. Just place the Spikes in the scene, preferably near the Spawn Point so that any player knows instantly that
