

Checking the position of the slider

points. The platforms can move horizontally, vertically, or even diagonally at any angle. You can also make the same platform travel over complicated paths, similar to the Patrol component in Playground. To do this, select the platform, and go to the Moving Platform component. Click on Add Node, which will make an additional Move gizmo appear. This can be repositioned to provide a waypoint. You can keep adding as many Nodes as you require, to define a path for the platform. There are a number of additional options here to tweak the behavior of the platform. You can make the platform move back and forth, loop a particular motion repeatedly, or move only once. It is also possible to change the speed and provide a duration for which it waits at a waypoint. If you need to platforms to align at a particular point, a good way to make sure of this is to start by positioning them side by side in the game, and then move them to where you want them to end up, at the same time making sure that the centers of the moving platforms travel the same number of tiles, either horizontally or vertically. Otherwise, you will need to tweak the timing in game till they align frequently, or change the value of the duration in the Game view while running the game, and then feed those values in the Scene view after closing the game.

The Moving Platform Component also has a slider called Preview Position. This will show a ghost of the platform, at each point in its path. As you drag the slider back and forth, you can get an idea of how the platform will move in the game, while still in the Scene View. **d**
