

Ellen steps on the pressure pad, there is a sound that plays, as well as a light that emerges from the pad. However, the door does absolutely nothing. This is because the door does not yet know to react to that particular pressure pad. Select the PressurePad and look at the Components in the Inspector Window. The one you are looking for is called Pressure Pad (Script). Here, you will see some elements of the Script in the Attributes as well. There is an On Pressed () section, and an On Release () section. The On Pressed section has three events by default. These events inform the Engine what to do when the Pressure Pad is pressed. These include playing the animation that shows the light, and playing the sound that indicates that the pad has been activated. We will be adding another event here by clicking on the + sign. By default, a new Runtime event is created. This means that the series of events will take place only while running the game, and not while editing the game. Find the Door Prefab in the Hierarchy (it will be under the Gameplay section), and drag it into the field that says “none”. The field to the Right currently says No Function. While the Pressure Pad script knows that when it is stepped on it has to do something with the door, it does not really know what to do. Click on the No Function drop down menu, go to **Animator > Play (String)**. This informs the Door Prefab that it is supposed to play back an animation when the Pressure Pad is stepped on. However, the Door does not know which animation to play back, and the action of adding the Animator function creates a new empty field. Go to **2DGameKit > Art > Animations > AnimationClips > Interactables** and you will find a bunch of animations that correspond

The door opening when you step on the pressure pad.
