

to the **Prefabs > Interactables** folder. You cannot simply drag these Animations into the Pressure Pad (Script) component. Instead, you have to use the same spelling of the animation clip in the empty field, which is “DoorOpening”. Now test the game by playing it. When you step on the pressure pad, the door “opens” by disappearing into the ground.

Do note that both the doors and the destructible block and doors are also available as sprite sheets in the **Art > Sprites > Interactables** folder, but they are not Prefabs that are set up with the associated Components, and as such will only be pulled into the Scene as static elements.

## Adding enemies

There are two enemy monsters included in 2D Kit. They are in the **Prefabs > Enemies** folder, and are called Chomper and Spitter. Chomper jumps at you and bites you, and has a melee attack, whereas Spitter stays put in one place and lobs globs of venomous slime at you. Each of their attacks consume 1 health, and they themselves have 1 health by default. Drag Spitter into the scene and position him below a ledge or a drop. He should be close to the wall so that Ellen cannot fire her gun at him, but Spitter should still be able to attack Ellen.

Adjusting the settings in the Enemy Behavior Component.
