

a race track, the friction that a spaceship experiences while turning and so on. You do not have to worry about art, background music, coding, and especially marketing. This is game design at its most fun, without all the tedious, repetitive, time consuming or boring tasks. In this Fast Track, we will be focusing on crafting the gameplay and designing the levels.

We will be using almost no code during this entire Fast Track, and what little code is there, is for demonstration purposes only, so that those who want to get deeper into it, can get an idea of exactly how comprehensible even the scripting is. This Fast Track will get you on your way to using Unity by walking you through all the basic concepts, how the various bits and pieces come together to make a game, and understanding the workflow for using Unity. We will be creating five games over the course of this Fast Track. The whole thing should only take up a day or two of your time. Note that we will not be making a complete game from scratch, which involves creating your own art and assets, a background sound track, a tileset, character sprite sheets, and plenty of scripts. However, this is a very quick way for beginners to get familiar with using Unity.
