

If Ellen loses health, the box breaks and Ellen receives health. However, if Ellen is skillful enough to dodge the gobs of venomous spit, then the box remains as it is, and Ellen can come back to it later if she needs it. There is no need to tweak any components or change any values. The Health Pickup Component does have a Health Value Attribute, which can be changed to say 2. Now, if Ellen has lost 1 health, it will still restore 1 health, and waste the remaining 1. The value can be changed to 7, so that Ellen always regains full health when she touches the HealthPickup Prefab, no matter how much damage she has taken.

Now, let us go ahead and add another moving platform, with multiple waypoints. This platform however, will not be moving right from the beginning like the other two. Instead, we will be using a trigger to initiate the movement. Create the moving platform, and make sure that it goes to another section of the map that Ellen cannot otherwise reach. Here, we will have to make sure that in `MovingPlatformlong (2) GameObject`, the `Moving Platform (Script) Component` has the `Start moving box` unchecked. This will make sure that the platform will not start moving as soon as you run the game. If there are multiple Prefabs in a scene, then they will be automatically numbered within the scene. Make sure that you make any changes in the Components and Attribute values in the Inspector menu after selecting the Prefab from the Hierarchy, and do not make changes after selecting the Prefab in the Project window. This is because any changes made to the Prefab in the Project window affects all instances of the Prefab in the scene, but any changes made to a particular Prefab in the Hierarchy only affects

Dropping the box to kill Spitter with the Health Pickup on the bottom right of the screen.
