

At times there can be way too many Gizmos on screen.

that particular instance of the Prefab in the scene. Any new Prefab sorted under the Gameplay, and Game Utilities spacers are automatically added to the top of the list, whereas all other assets are automatically added to the bottom of the hierarchy. If finding any particular GameObject becomes difficult, it is a good idea to use additional empty GameObjects as spacers, to differentiate between GameObjects placed in various locations on the map.

Now, back to the Moving Platform. The reason we unchecked the Start Moving box is to set up a trigger that will make the platform start moving, similar to the pressure pad used to open the door. Go to **Prefabs > Interactables** and select the SingleUseSwitch and drag it into the scene view. If the associated gizmos make it difficult to actually see and manipulate the switch, simply click on the Gizmos button to toggle all the gizmos throughout the scene. You can click this button again whenever you want to see the gizmos. Now you can play the game to check out the switch. You will need to shoot it to turn it on, and it cannot be turned off again. Since shooting it is not possible while standing up, you will have to crouch to do this. The key for crouching is S. The switch plays a sound effect when shot at, and starts glowing. There are also some subtle particle effects, but nothing else happens. This is because the game engine has to be informed to start moving the platform when this switch is activated. Let us understand a bit more about how the SingleUseSwitch is set up. Select the Prefab and look at the Components. The Interact on Trigger 2D (Script) Component has a Layer option, which is set to the Bullet layer. This is why the switch gets activated when shot at, but not when it is hit with the staff. Under the
