

Now, when you hit play, once Ellen shoots at the trigger, the platform starts moving. Ellen will have to also move fast to catch up to it, because if she does not make it to the platform in time, she will have to wait till it reaches its destination and comes back. A smart way to approach this is to get on the platform, and then shoot the switch. Now, you can make this a two way switch, activate the platform through a pressure pad, or activate a door through a switch. You can also make the same switch or pressure pad activate a series of doors or platforms. The pressure pads and the switches in this example were situated close to GameObjects that they would be affected by, but you do not need to do this. A pressure pad that activates a door can be at another end of the map. All these options will allow you to get about creating plenty of interesting maps and even puzzles.

Spitter in the bushes with the Gizmos turned off. Can you spot him?
He is right in front of you!

Adding more obstacles and enemies

After navigating the moving platform, let us add some more challenges and perils. Go to **Prefabs > Interactables** and select the **DestructibleColumn** Prefab. Drag this into an appropriate spot in the scene, and if there isn't one already present, make one using the **Tile Palette**. The starting health of the column is set to 1, so we will need to strike it only once with the staff. The Component with the **Health** attribute is not located on the top level of the Prefab, but in the daughter GameObject, **DestructibleColumn_Whole**. Now beyond the destructible column, let us place another Spitter. But instead of being in view, let us make Spitter ambush Ellen from behind some bushes. To do this, drag in a suitably large and bushy plant from **Art > Sprites > Environment** into the scene, and in the **Sprite Renderer** Component,
