

look for Inventory Item. Do not use the Inventory Controller, which is the Component added to Ellen. If you are showing Gizmos in the scene, you will see a huge white circle around the Key Prefab. This is the Circle Collider 2D Component, which is several times larger than the key. If Ellen walks into this large circle, then the key will be picked up. We want a smaller collider. So click on the Circle Collider 2D component, and reduce the radius so that it just about surrounds the key. The Inventory Item (Script) Component has an Inventory Key attribute, which has a totally different meaning than the

On the left is Ellen's Inventory Controller Component, on the right is the Key Prefab's Inventory Item Component. The value in the Key1 section's Key field on the left should match the value in the Inventory Key Attribute's value on the right.

object used to open a door. The “key” in the Attribute is a unique identifier. The same meaning is also used in the Inventory Controller Component on Ellen, with the Key 1 section having a Key Attribute, with the value of Key1. This can be a little confusing, so refer to the image.

Go to the Inventory Item Component on the Key Prefab, and key in “Key1” (sorry, we could not resist doing that). Below the Inventory Key Attribute is a Layers drop down menu, which if you remember, works like tags in 2D Kit. At this moment, anything with an Inventory Controller Component can collect the key, which is not desirable. If for some reason we include say an Inventory Controller Component on a monster, it can collect the key by mistake, and Ellen would not be able to pick it up. First select Nothing to clear all the selections, then select the Player layer. This ensures that only Ellen can collect the key. Now if you walk past the key, it gets added to Ellen's inventory, but the Key Prefab remains in the scene. Someone else playing the game will have zero indication that the key has been collected at all. Unlike many of the other elements in 2D Kit, the key collectable does not
