

have a preset audio cue. However, there are a bunch of audio cues included in the project for your convenience. Go to **Audio > Interactables** and select the GenericPickup sound. Drag and drop this into the Clip field of the Inventory Item Component on the Key Prefab. Also check the Disable on Enter box, which will make the key disappear when Ellen walks into it.

There is still another thing that we can do to make absolutely sure that the player knows that they key has been collected by Ellen, by using the UI to give a persistent visual on screen to indicate that there is a key in the inventory, which needs to be used on some door. Go to **Prefabs > UI Prefabs**. Click on the KeyCanvas Prefab (not the KeyIcon Prefab) and drag it below the UI spacer in the Hierarchy, which is totally empty at this point. On the top right corner, three empty slots will appear, which can be filled up to three keys as you collect them. However, for this level, we only need only one key, so you can go to the KeyCanvas, and change the size to 1 from the default 3. The other two keys will disappear, and the slots for them will not show up on the Inventory.

Adding a circle collider to a rectangular door, to trigger the open animation when Ellen walks within the limits of the circle.

Now, let us place another door somewhere far away from the place where we collected the Key Prefab. Go to **Prefabs > Interactables** and click and drag the Door Prefab into the Scene. We are going to add a Component to the Door (1) Prefab that will inform it that when Ellen approaches it with the key in the inventory, then the door can be opened. First, we will have to add a collider to the Door. Normally, we would be using a BoxCollider, as that is the shape of the door, but we need the Collider to detect Ellen in its
