

Using the teleporters to move Ellen past obstacles that otherwise cannot be passed.

range. For this reason, you can add a BoxCollider or CircleCollider on the door, but extending beyond the actual door into the area around it. We are going with a CircleCollider 2D. Click on Door (1), click on Add Component and look for Interact On Trigger 2D. Increase the value on the Radius attribute, till a white circle covers the area where you want to be able to open the door. If Ellen walks into this circle, the door will open. Now add, the Interact On Trigger 2D component. You can change the Layer to Player from Everything, but as only the Player can possibly collect the Key in the first place, we can leave this unchanged. Now, go to the Inventory Checks section, and type in 1 in the Inventory Size field. This will create an Element 0 section, expand it, and enter the value 1 in the Size field, and in the Element 0 field, enter “Key1”. This box can be set up so that you need three or even say seven keys to open a single door. Under the On Has Item () section, drag and drop the Door (1) Prefab into the empty slot that currently says None. Click on the No Function drop down menu, and go to **Animator > Play (String)**, just like you previously did with the pressure pad. A blank field will appear below the Function, type in DoorOpening there. Note that in this step, if you add the DoorOpening Event in the OnEnter() section of the Component, the door will open whether or not Ellen has collected the key.

Adding a teleporter

Now, we are heading towards the final stage of the level that we will be creating, and to do that let us create a wall that cannot be destroyed. We will set up a teleporter for Ellen to use to go to the other side of the wall. Draw this wall using the Tile Palette. Then go to **Prefabs > Interactables** and drag the Teleporter into the Scene. On the other side of the wall, add
