

The settings for the teleporter

another Teleporter, which will automatically be named Teleporter (1). Now select the Teleporter Prefab in the Hierarchy, and have a look at the Components in the Inspector. Right at the bottom, will be the Transition Point Component. The first item on the list is the GameObject that needs to be teleported. Drag and drop the Ellen Prefab into this field, because you want the teleporter to work

on Ellen. The Transition Type is set to Different Zone by default, we will need to change it to Same Scene. A Destination Transform Attribute will appear. You can drag in any GameObject to this field, and the Teleporter will move Ellen to that GameObject or Prefab within the scene. Drag and drop Teleporter (1) from the Hierarchy into this field. Note that you can add another key to the level, and check the inventory for Key2 before allowing Ellen to use the Teleporter. There is also a Transition When field. This can be changed to On Trigger Enter, which will simply teleport Ellen when you walk into the Teleporter. However, we can make the player press a button before the Teleporter activates. To do this, select the Interact Pressed option. By default the button to activate a switch or interact with elements is set to E. On approaching the teleporter and pressing E, you should now instantly be teleported. Repeat the steps with Teleporter (1) but using the Teleporter Prefab as the Destination Transform Attribute, to make it so that tapping E while at Teleporter (1) will move you back to the location of the Teleporter. In the next chapter we will be looking at adding dialogue boxes to guide the player through more complex interactions. **d**
