

Apart from informing the player which button to press, dialogue boxes can also be used to provide flavour text, or some kind of background story to what is actually going on in the game. We will be giving one example of such a text box.

Go to **Prefabs > UIPrefabs** and select the **DialogueCanvas**. By default, this Prefab is greyed out, which means that it needs to be enabled within the game, by some kind of trigger event. Go to **Prefabs > InfoPost** and drag it into the scene, preferably somewhere close to the Teleporter. Go to the **OnEnter()** section, and keep it in view. Now, click and drag the **Dialogue-**

Adding dialogues to the Scene, triggered by walking into an Infopost.

Canvas Component from the Hierarchy into the field that currently says None. Click on **NoFunction**, and select **DialogueCanvasController > ActivateCanvasWithText**. Now, in the field that says **INFOPOST1**, type in the text that you want to display in the dialogue box to the player. When the player walks across this Infopost, a pop up dialogue will prompt the player to press E to activate the teleporter. You can set up similar Infoposts all across the map wherever necessary, for example, to activate the switch to move the platforms, to use the staff to smash through obstacles, or to even warn players of monsters ahead.

Remapping controls

If you feel that the default control options are a bit clumsy, there is a way to fix it. However, you will need to make the changes in the Prefab, and not the instance of the Prefab in the Hierarchy. Such a change is always dangerous to make in a project as vast and complicated as this, because the changes will be made to the Elen Prefab in the Project window. This
