

(but not background, we will be reserving that name for a bucket of all background elements). Keep it selected, and go to the Inspector panel, and click Add Component. Find and add the Video Player Component. Check the Play on Awake box, as well as the Loop box. The Playback Speed slider can be used to adjust the speed of the animation. Leave the Playback speed on 1, and change the Render Mode to Material Override. In the Video Clip field, drag and drop the .mp4 file. Scale the background, and your animated background is all setup.

Note that strictly speaking, this is not the best way to place a background. Playing a video on loop constantly is demanding on the system resources, especially if it is an HD file. If you have a system that is not too powerful, then simply use a static image as the background. The animations in the visualisation are anyway subtle. However, we wanted to demonstrate how to use a video texture on a GameObject, so you can come up with your own creative applications.

Now, scale the background as you see fit. In the Sorting Layer, select Background, and set the Order in Layer value to something like -50. This is because we will be adding additional layers, between the background and the player. Since this is not a tiled background, we will just be scaling the image so that it occupies the entire play area. We will have to look at and define the play area now. Select the Camera, go to the Game View, and pick an aspect ratio along the top bar. We went with 16:9.

Our background is not yet done. We will be adding particle effects, to make it look like some stars are moving in the background, between the

The default particle generator
