

half of what was set previously for the background_stars GameObject, which works out to 31. The Rate over Time value can be slightly increased. Now, we will be making the stars twinkle. For doing this, check the Colour over Lifetime Subsection, then expand it. You will get a colour box. Double click on it. Add in Keypoints, and alternate between grey and white, and make sure the Mode is set to Blend. You can add as many as 8 keypoints, and be sure to use them all. Do not make the distribution regular, but randomise it. The same process needs to be repeated for both the foreground_stars GameObject as well as the background_stars GameObject. Create a new Empty GameObject, and rename it background. Drag the background_image as well as the background_stars and the foreground_stars GameObjects into this empty game object. Drag it into the project folder to create a Prefab. This Prefab, will serve as the background for our space shooter. Remember to keep saving your project. Do so now, you will have to name the new scene. Then, hit play and behold your fancy scrolling background with a parallax effect made using a particle generator, which was not intended for that purpose at all.

For organisation purposes, it is better to start right from the very beginning. Create a new folder in the root of the project

The gradient editor window

menu, and name it SpaceShooter. Drag all the assets used to create the background into this folder. Then make a subfolder called background, and drag all the assets into that again. Also make empty GameObjects for spacers, and rename them --Essentials--, --Player-- and --Enemy--. Drag the Camera GameObject as well as the Background Prefab under Essentials. Moving about the assets within the Project folders does not affect the way they are used in the scene, or in any of the dependent Prefabs. The Scene can be left in the root folder for now, for easy access.

Setting up the spaceship

For this step, we will be repeating most of the steps necessary to create the base game that we first created in Unity Playground. We will, however, not need the camera to track the ship. For this game, we got a very cool space-
