

so that they can continue to work on and update their games. Unity ships between three and four main releases, called the Tech Stream releases every year. Each of these are patched. The final release of the year is called the LTS release, which receives updates for two years. Under Installs submenu, select Add. Normally, the procedure would be, select the latest version available under “Latest Official Releases”, then click on Next. At the time of writing, the latest version was Unity 2019.3.8f1. However, for the purpose of this Fast Track, we will need to use Unity Playground, which is not yet supported on the latest version. The last version that supports Unity Playground is 2019.2.21f1, which is the one you need to install. After the year, the first digit are the milestone releases of the year. The number following the milestone

Multiple versions of Unity in the Unity Hub

release is the patch number, which counts the hotfixes and other updates to the engine. The f denotes that the release is final. The other letters are for alpha, b for beta and rc for release candidate. You will almost always need to use the final releases only. Now, you have to select the additional platforms that you intend to export to. If you only want to play on your desktop, then go ahead and skip this step. If you want to try out your game on smartphones, select the Android or iOS add on packages before proceeding.

Now, click on Learn, and browse through the projects here. Now, find and click on “Unity Playground”. Another way to do the same thing is to go to **File > New Project**. Then, select 2D project and provide a name for the project. Once a blank project has loaded, go to **Window > Asset Store**. In the search bar for the Asset Store, look for Unity Playground. Once you find it, click on Import. This is a special type of asset, in that it is a complete project instead of say, just one spaceship, or just one health bar. It replaces everything else already loaded in a project. There will be a prompt for depend-
