

p_flame prefab to 1 and on the spaceship to 2, so that the flame appeared below the spaceship. Add the Polygon Collider 2D as well as the Health System Attribute to the ship, and provide a generous amount of Health, say 50. Change the tag to Player. Set up four laser blasters for all the tiny barrels, and remember to check the Is Trigger box on the Capsule Collider 2D component. This can be done by creating a Prefab for a blaster to spawn the projectile, then duplicating it three times. Make sure to adjust the speed and scale of the bullets relative to the spaceship, as you do not want a tiny ship blasting out huge lasers.

Parent the p_flame prefab, the four Blaster Prefabs, to the player-ship GameObject. You might have to rescale the p_flame prefab, as it might suddenly become too large for some reason, a problem not seen with the

Lots of bullets

blasters. The dimensions go wack when working with particle generators (the blasters are not particle generators, even though they appear as such).

Go through the same process for the blaster prefab, using another, slower projectile with a lower Creation Rate called missile-blaster. Map it to a different button, say V or Left Ctrl. Add these missile-blasters on either side of the spaceship. You can also add tiny p_flame prefabs to the missiles for bonus coolth. You can also use more particle generators shaped like a cone. Just use a large Circle Collider 2D instead of a Capsule Collider 2D for splash damage.

We are using a lot of particle effects, as well as an HD video looping in the background, all of which together are demanding on system resources.
