

We will be repeating the step for creating the projectiles, converting them into Prefabs, adding alien-blasters, and positioning them on the alien scripts. The direction of the blasters can be tweaked so that they blast the projectiles at various angles across the screen. We do not have a button to press, so we will be using the Condition Repeat Component to generate the bullets. Add the appropriate Components to the bullet, convert it into a Prefab, and then select it as the Prefab to Create in the Create Object Action Component that gets automatically added along with the Condition Repeat Component. This also means that you will have to put in the values for the bullet movement on the projectile itself, which can be done through the Auto Move Component. To make the Projectiles move at an angle, use values such as 5,5 for the X and Y axes. As a checklist, for the projectiles you will need the Transform, Sprite Renderer, Capsule Collider 2D, Rigidbody 2D, Bullet Attribute, Modify Health Attribute, Auto Move, Condition Repeat and Destroy Action Components. For the alien-blaster you will only need the Condition Repeat and the Create Object Components, as most of the heavy lifting will be done by the bullets themselves. For various firing angles, you will need to create multiple copies of the Prefab. Duplication of Prefabs is not possible in the Project window, but you can use Explorer and rename copy+pasted Prefabs to duplicate them. The same alien-shooter Prefab can be used to fire different projectiles at
