

various angles, simply drag and drop the relevant projectile Prefab in the Prefab to Create field. Once you have daughtered all the blaster Prefabs to the mothership, add a Patrol component and set the waypoints. This is for the main ship, which the player will have to defeat to win the game.

One of the things that you may notice is that even when the ship is out of the screen, the fired projectiles may still come towards the player. This may serve as an indication of the location of the alien mothership before it actually appears on screen. However, if you want to remove the bullets before they appear on screen, you will have to tweak the values of the Condition Repeat Attributes, to make sure that bullets get destroyed after crossing one screen width of space, then keep the other offscreen waypoints of the patrol more than one screen width away from camera view. Make sure to tag the Alien Mothership as Player2.

Now, we will be repeating the process for other enemy ships as well. We will be using the projectiles and blasters already used for the Alien Mothership. Next, we will be making prefabs with 2-3 different types of alien ships. They can be strung up diagonally, horizontally, or in various formations of your choice. The ships of different kinds can be put together, or separately. Either way, each of these formations will comprise of a single wave. All the ships together will be daughtered to an Empty Game Object, which can be named Wave 1, Wave 2 and so on. Next, we will use the Object Creator Area to spawn these waves. We will be using a different Object Creator Area for each wave. We will also make sure that the patrol paths of no two waves

A wave of aliens attacking the spaceship.
