

Trying to memorise all the passwords thoroughly or writing them down in papers isn't a guaranteed solution. Some people try to use the same password for everything. However, that stands a risk of their security being compromised, causing a data breach. There is also another option of saving the credentials on your system, which doesn't require the user to manually put in the details every time. In this case too, the breach of security is evident.

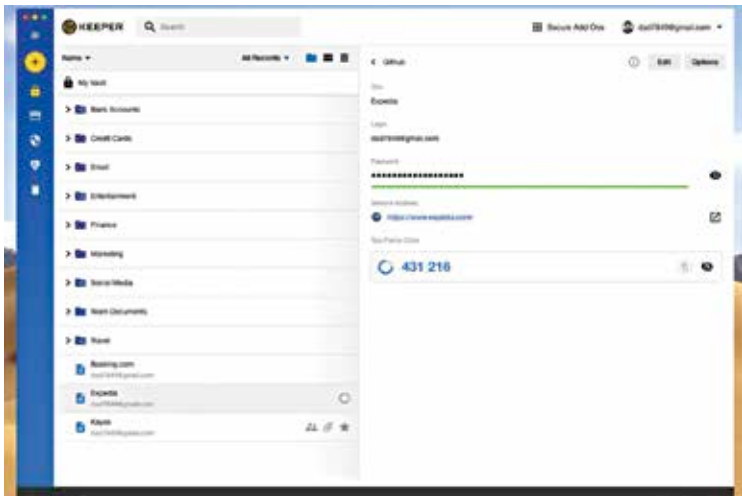

Here are a few ways to ensure proper security for your data and never forget a password again:

Password managers

Excellent for handling such situations, these plug-ins can be installed to provide easy access to your passwords. It often happens that a single user has multiple accounts on one site. In such cases, password managers are quite helpful. These plug-ins, while installed in your web browser, will even provide you with the option of choosing one of the credentials first when you need to input it. You can install trustworthy password managers on your web browser, free of cost. Not to mention, there are some password keepers that offer an affordable monthly subscription in exchange for their reliable services.

Digital lockbox and their valuable services

Rather than writing your passwords on a piece of paper and standing the risk of exposing it to unauthorised users or losing it, use digital lockboxes as
