

password protectors. They encrypt your usernames and passwords safely for you to access it every time you log in. Install them on your device and keep your passwords safe. Note that they work the same way as the browser plug-ins.

We all check our social media handles, emails, and messages daily. Therefore, plug-ins can be used on secure web browsers to remember your passwords so that you don't have to manually enter the details every time you log in. They encrypt your information and do not let any third party access your details. In that case, there should be a strong password to protect your personal information.

Tip sheets

Just as the name suggests, tip sheets will provide you with essential tips to remember your password. It is safer than maintaining a list where the password is visible to everyone. Make sure to create a fairly unique clue that only you can use to remember your password. The answer to that hint should not be obvious to anyone, leading to a breach of data. In this case, acronyms are essential to remind you of the passwords.

Jog your memory!

It is very important to have a hint that does not give it away too easily, but works perfectly for the authorized users to jog their memories. For instance, a word that rhymes with your password. You can use the first letter of your password followed by the alphabets replaced by their serial numbers, or you can use the numbers followed by the last letter of your password. This is one of the most effective ways to jog your memory and retrieve the password in your mind when you seem to forget it. This technique can also be used to write down passwords in paper or diaries.

Notepads

Maintaining a black book is even easier with technology. You can maintain a record of all the passwords that you use for different sites in the notepad. It may have a downside where one takes the risk of the file becoming accessible to unauthorised users. Therefore, a simple trick is to hide it in a chain of folders on your desktop. You can also do the same in a spreadsheet and encrypt it so that no unauthorised user can access the details.

Research shows that the best way to secure your sensitive information online is to create a unique password that only you can understand from the given hints.
