

Stay away from the obvious

Some users keep passwords as simple as 123456789 or their full names. There is a strict rule to avoid all sorts of patterns or common passwords such as serial numbers, birth dates, and phone numbers that can be easily guessed by people. Make something unique even from the most regularly accessed personal details to raise your security.

Create a base password

This is one of the most popularly used tricks to create a unique and strong password. It must be related to the services that you are accessing on the particular site. One needs to add the first few or the last few letters of the site that they are on, followed by their passcode. It can work the other way as well – use the first or last few letters of the site on both ends to protect your unique code in the middle. That way, even if you use the same password for everything, it is something unique every time.

The “alphabet-number” trick

Widely used by people to protect sensitive information and data, the alphabet-number trick is quite efficient to create a strong password. In this case, one just requires to replace the alphabets with numbers. For instance, A is the first letter and therefore, will be written as 1. If your name is Anna, the password will be 114141. You can also use letters in-between numbers instead of all numbers so as to avoid any sort of pattern that can be used for guessing. This has been proven quite helpful to several users.

The three-password rule

It is, of course, very unsafe to keep the same password for everything. That way, the total security of your sensitive information will be compromised easily. However, it is also not feasible to use unique passwords every time you log in to a site. Therefore, the three-password rule is perfect. All of our online logins can be categorized into three types- general, social, and transactional.

- It is recommended to use a standard password for general logins such as online shopping, blogs, or similar kinds that don't have such vital information. For instance, use the name of your most preferred daily newspaper, date of birth+ workplace name, characters that aren't found in the dictionary, etc.
- Use a secure password to protect sensitive information on social media networking sites such as Gmail, Facebook, Twitter, and so on. In this
